# AI Decision Firewall

Customer Support Lead | One-page decision policy | Lumen Cloud (fictional)

## Gated action and evidence

Only APPROVE calls the local mock send_email action. The wrapper calls the simulated Ezio API over HTTP, then independently checks the supplied price_sheet.csv and policies.json for plan prices, discounts, eligibility, stacking, refunds, trials, and response times. Multiple claims in one draft are evaluated separately.

## Decision rules

| Condition | Decision and reason |
|---|---|
| Company fact contradicts source data; ineligible or stacked discount; Ezio contradicts a checked claim | BLOCK. A known false or disallowed customer statement cannot be sent, even with an overall GREEN tier. |
| Product or delivery commitment, guarantee, unverifiable claim, missing eligibility context, or unavailable fact check | HOLD_FOR_REVIEW. A lead must verify or revise an unsupported promise. |
| Tone below 65; bias below 55; agreement below 55; or YELLOW/RED tier without a contradiction | HOLD_FOR_REVIEW. Weak communication signals merit review; BLOCK is reserved for material contradictions. |
| No contradiction or review trigger | APPROVE. Routine replies and supported facts should pass without false holds. |

## Accuracy and failure behavior

Scored: use per-claim verdicts and contradicted counts. Not scored: permit if independent company checks find no issue; routine messages may contain no extracted claims. Unavailable, malformed, or exhausted retries: hold unless a company-data contradiction independently requires BLOCK. The HTTP client makes at most four attempts with bounded 429/503 backoff, a 15-second attempt timeout, and a 45-second total budget.

## Audit and human review

Every ordinary decision records UTC time, input, context, full Ezio response, supporting evidence, reason, decision, and action status. A reviewer may record a rejection or revision plan with a written reason. A revised draft must pass the same gate before any mock send. Review notes never trigger an action.
